

# A One-Off Wealth Tax to Fund a Sovereign EU Fund

Adrien Fabre

July 8, 2026

Who owns and steers Europe’s productive capital has become a first-order public question, from the ownership of critical infrastructure to the control of frontier technologies. Citizens from 40 jurisdictions hold a collective stake in large firms and long-term investments through Sovereign wealth funds (SWFs). Sovereign funds are no longer the preserve of resource-rich states: China, Singapore, Australia, and South Korea each have a SWF larger than 10% of their GDP, while Canada launched a national fund in 2026 financed by public debt. Worldwide, sovereign wealth funds manage assets worth close 13% of global GDP, yet the European Union has no comparable fund.

This appendix argues that the EU should build one, and finance it with an exceptional, one-off tax on large individual wealth. The revenue could be used directly as a new own resource—paid into the EU budget, or used to service and eventually repay the common NextGenerationEU debt contracted during the Covid crisis. We propose a more judicious use. Sized at 5% of EU GDP, the levy would build up a fund whose assets would eventually reach about twice that common debt, so that its long-run dividends would exceed the interest owed on the debt several times over. Rather than use the proceeds to shrink the Union’s sovereign balance sheet by repaying the debt, we would invest them in European companies—a more strategic use of resources at a time when major investments are needed for the ecological transition and for competitiveness—while the fund’s dividends would themselves constitute a durable new own resource. The underlying levy is, in any case, fair, popular, and non-distortive.

The proposal deliberately avoids the pitfalls that have historically undermined recurrent wealth taxes. It is a *one-off* levy, assessed on the net wealth each resident holds on a single reference date (1 January 2027). The one-off liability is computed at low annual marginal rates: 0.1% on wealth between EUR 1 and 10 million, 0.3% between EUR 10 and 100 million, and 0.5% above EUR 100 million, over thirty years. Because the base is fixed in the past, the levy is a lump sum in the economic sense: no decision taken after 2027—to invest, to found a company, or to emigrate—can change what is owed, so the tax does not distort future accumulation and the entrepreneur who creates value after 2027 owes nothing on it. The low annual rates keep the tax non-confiscatory and, as Section 4 argues, comfortably within constitutional bounds. Liquidity is addressed head-on: each year the taxpayer owes the *smaller* of the scheduled instalment or the annual rates applied to current wealth, and may pay by handing over shares in companies. Deferred amounts are secured by a Deferral Account, whose outstanding balance the State recovers when the taxpayer dies or moves their tax residence outside the EU, which is what makes the levy enforceable against emigration.

The intellectual lineage of the proposal is explicit. It adapts the deferral and one-off mechanism designed for the Californian wealth-tax bill ([California State Legislature, 2023](#)), and adopts the low-rate one-off logic of [Pisani-Ferry and Mahfouz \(2023\)](#), who recommended an exceptional levy

of 5% of GDP spread over thirty years to finance the climate transition. Unlike the recurrent net-wealth taxes still levied in Spain, Norway and Switzerland, and unlike the abolished taxes of Germany, France and other Member States, the present proposal is designed from the outset to survive the yield, constitutional and behavioural objections that sank its predecessors.

The instrument also rests on solid economic foundations. In the canonical model of optimal taxation with aggregate shocks and incomplete markets, [Farhi \(2010\)](#) shows that the efficient fiscal response to a negative shock to the government’s budget is precisely a one-off capital levy. The overlapping shocks that motivate new own resources—the pandemic-era debt, the security build-up and the financing of the transition—are exactly the contingency for which theory prescribes a backward-looking capital levy. Progressive wealth taxation is independently justified on distributive and corrective grounds. [Saez and Zucman \(2019\)](#) argue that a wealth tax reaches the *stock* of fortune rather than the *flow* of realised income, and is therefore the most direct tool for restoring progressivity at the very top—where the ultra-wealthy report little taxable income relative to their true economic income and thus largely escape the income tax—and for checking a concentration of wealth that, left unchecked, corrodes equality of opportunity and the democratic process.

The remainder of this appendix sets out the proposal in detail (Section 1), provides country-by-country revenue estimates (Section 2), describes how the tax would interact with the wealth taxes that already exist in the EU (Section 3), responds to the main objections (Section 4), and briefly lists possible variants left for future work (Section 5).

# 1 Proposal

## 1.1 A one-off tax, payable over thirty years

We propose a one-off tax on individual net wealth, assessed on the wealth each resident holds on 1 January 2027. The tax is strictly individual: wealth is attributed to natural persons, with couples assessed on their respective shares, so as to avoid the marriage penalties and avoidance opportunities associated with household-level assessment.

The headline schedule is a one-off liability levied at *marginal* rates: 3% on the fraction of individual wealth between EUR 1 and 10 million, 9% on the fraction between EUR 10 and 100 million, and 15% on wealth above EUR 100 million. This liability is not due immediately. It is spread over thirty years, so that in any given year the taxpayer owes one thirtieth of the total: the annual tax schedule is 0.1% on wealth between EUR 1 and 10 million, 0.3% between EUR 10 and 100 million, and 0.5% above EUR 100 million. These annual rates are deliberately calibrated well below the return on capital, so that the tax can in principle be paid out of the income the wealth generates, leaving the principal intact.

The one-off character is the central design choice. A permanent wealth tax changes the incentive to accumulate, to invest and to remain resident on an ongoing basis; the empirical literature finds that such taxes can generate behavioural responses, from portfolio reshuffling to migration (Brühlhart et al., 2022; Durán-Cabré et al., 2019). A one-off tax assessed on a past reference date is, by construction, a lump-sum tax: it does not distort decisions taken after the reference date, because no future choice can change the liability. This is the classical efficiency argument for capital levies, and it is the reason Pisani-Ferry and Mahfouz (2023) favoured an exceptional rather than a recurrent instrument.

## 1.2 Payment, deferral and the annual minimum

Each year, the taxpayer must pay the *smaller* of two amounts: (i) one thirtieth of their initial liability, indexed to inflation and increased by a deferral penalty; or (ii) the annual schedule (0.1% / 0.3% / 0.5%) applied to their *current* wealth. The second option protects taxpayers whose wealth has fallen: someone who has become poorer since 2027 pays less, in line with their ability to pay. The tax ceases to be owed after thirty years, or earlier if the taxpayer settles their remaining liability in full.

The deferral penalty reflects the fact that postponing payment is equivalent to paying upfront for the taxpayer, hence it reflects the return the taxpayer earns on the deferred sum. We set it at 3% per year for the tax due below EUR 10 million, 5% between EUR 10 million and 100 million, and 7% above EUR 100 million. These figures are aligned with the empirically documented gradient of returns to wealth: larger portfolios earn systematically higher average returns (Chancel et al., 2022). Aligning the penalty with the return on capital ensures that deferral is neither a subsidy to the wealthy nor a confiscatory charge, and removes the incentive to game the timing of payments.

## 1.3 Payment in kind

Liquidity is the objection most often raised against wealth taxes: a taxpayer may be rich on paper yet hold most of their wealth in illiquid form—a stake in an unlisted company, real estate, or an art collection—that generates little cash, so that a tax payable in cash could force them to sell assets, sometimes at a discount and sometimes at the cost of control over their business.

The proposal neutralises it through a graduated set of payment options. First, the administration accepts payment in non-cash liquid assets, in particular shares in listed companies, valued at market price on the day of transfer. A taxpayer whose wealth consists mainly of a quoted equity stake can therefore discharge the tax without selling on the market and without any cash outlay. Second, on a case-by-case basis, the administration may accept payment in illiquid assets—such as shares in non-listed companies—to the extent that the taxpayer’s liability exceeds their liquid assets. This mirrors the logic of the Californian bill, which allowed liquidity-constrained taxpayers holding designated highly illiquid assets (typically start-up equity) to attach a claim to those assets rather than face an immediate cash assessment ([California State Legislature, 2023](#)).

Payment in shares has an important corollary for the objection that a wealth tax penalises young, capital-intensive firms relative to established ones. Because the founder of a start-up can hand over a fraction of their shares rather than cash, the tax does not force the sale of the company and it does not require the firm to distribute dividends it cannot afford.

## 1.4 Deferral Accounts

Unless they settle their entire liability in the first year, taxpayers must open a Deferral Account (DA): a contract with the State to which they attach assets of sufficient value to cover the tax liability. The DA has three functions. It secures the State’s claim: the outstanding liability is recovered when the taxpayer dies or moves their tax residence outside the EU, whichever comes first, and the account is closed only once the tax has been paid in full. It supports the payment-in-kind mechanism, since attached assets can be realised to discharge the debt. And it provides the enforcement backbone against emigration: because the liability crystallises on exit from the EU, relocating after the 2027 reference date does not extinguish the tax, which sharply limits the fiscal-flight response that has undermined recurrent national wealth taxes.

A missing payment triggers a penalty equal to inflation plus 10% per year on the overdue amount. This penalty accrues within the DA and is ultimately recovered when the attached assets are sold or generate dividends, so that non-payment is costly but never forces an immediate ownership transfer. The combination of low annual rates, deferral, payment in kind and asset-backed recovery is what makes the tax simultaneously enforceable, non-distortive and respectful of taxpayers’ liquidity constraints and asset control.

## 1.5 Governance and mandate of the fund

The proceeds endow a European sovereign wealth fund under democratic control. Its board would be appointed by the political groups of the European Parliament, each group naming board members and exercising a voting right proportional to its number of seats, so that the fund’s direction reflects the Union’s democratic balance rather than the discretion of a single executive.

The fund’s mandate would be threefold: to hold a broadly diversified portfolio of equities, so as to spread risk and secure a stable return; to steer the ecological transition; and to select strategic investments that strengthen Europe’s future-preparedness. Within that mandate, priority would be given to *primary* investments—initial public offerings, capital increases and other subscriptions of newly issued equity—in European companies with a strategic dimension or a sustainable project, so that the fund channels fresh capital into productive investment rather than merely reallocating ownership of existing shares.

## 2 Revenue estimates

### 2.1 Method and assumptions

Revenue is estimated by microsimulation on the 2023 wealth distributions of the World Inequality Database (WID). For the sixteen Member States it covers, we use the tabulation that underlies the [WID Wealth Tax Simulator](#), which reports, for a grid of euro thresholds, the total net wealth and the number of adults above each threshold. This dataset is the more adequate source, for two reasons: its grid already includes the statutory cut-offs (EUR 1, 10, 100 million and 1 billion), so each bracket’s base can be read off directly; and it smooths the top tail, so it resolves the extreme fortunes on which the upper brackets depend.

The eleven smaller Member States that the simulator omits are completed from the raw WID distributional-national-accounts data, which report the average wealth within each of 127 population brackets, up to the top 0.001%. Applying the schedule to those bracket averages reproduces the lower brackets well but resolves the very top less finely; because these states are small—their combined contribution is about EUR 0.6 billion—this has no material effect on the EU total. A single 30% haircut is applied to the base throughout, to allow for asset-price depreciation, valuation discounts and evasion. Columns a to d report the annual instalment at, respectively, 0.1% above EUR 1 million, 0.3% above EUR 10 million, 0.5% above EUR 100 million and 2% above EUR 1 billion; the central scenario is  $a + b + c$  (also shown as a share of 2023 GDP) and the top-heavy variant is  $c + d$ . All figures are in EUR million per year.

### 2.2 Results

Table 1: Estimated revenue of a one-off wealth tax in the first year, by EU Member State (EUR million per year; a 30% haircut on the base assumed). The GDP column reports annual central revenue as a share of 2023 GDP.

| Malta              | 8            | 0             | 0              | 0             | 9                  | 0.04%            | 0             |
| <b>EU-27 total</b> | <b>9,667</b> | <b>6,091</b>  | <b>9,688</b>   | <b>19,886</b> | <b>25,447</b>      | <b>0.15%</b>     | <b>29,574</b> |

The central scenario—the three low brackets combined—raises about EUR 25.4 billion per year for the EU, or close to EUR 760 billion over the thirty-year horizon. This is on the order of 4% of EU GDP, in the range of the 5%-of-GDP benchmark independently proposed by [Pisani-Ferry and Mahfouz \(2023\)](#), and comparable to the annual servicing cost of the EU’s common NextGenerationEU debt. The revenue broadly tracks the distribution of large fortunes across the Union: Germany and France together account for more than half of the central total, and the five largest economies (adding Italy, Spain and Austria) generate around 80%. This geographic profile is a feature rather than a drawback. The proceeds are not consumed but channelled into a European fund that reinvests in productive companies; a fund managed on a competitiveness logic would in any case direct much of its capital towards the Member States that host Europe’s largest firms and deepest capital markets, so that the country pattern of contributions and the country pattern of investment would broadly coincide. Germany leads the central scenario on the strength of its broad upper-middle wealth (the EUR 1 and EUR 10 million brackets), while France leads on the upper brackets. The top-heavy variant (columns c and d) raises about EUR 29.6 billion per year, drawn from a few thousand centi-millionaires and the EU’s billionaires.

These estimates are deliberately conservative for two reasons. First, they apply a 30% haircut to the base, well above the leakage a well-enforced one-off levy should suffer. Second, they value wealth as of 2023, whereas the tax would be assessed on wealth held on 1 January 2027: since asset prices—equities and real estate in particular—have risen materially since 2023, the true 2027 base, and hence the revenue, would be larger. The numbers are also static, abstracting from behavioural responses, which for a one-off tax on a past date should be small (Section 4). All figures are reproduced by the script `wealth_revenue.R` accompanying this appendix, which reads the WID Wealth Tax Simulator dataset and exports the country-by-country tables to `wealth_revenue_tables.xlsx`.

### 3 Interaction with existing taxes

The proposed levy would be *additional* to, not a substitute for, the taxes Member States already apply to wealth. Within the EU only Spain still operates a comprehensive recurrent net-wealth tax, and the few other national instruments are narrow. Crucially, all of them share a feature that

the present proposal deliberately avoids—they largely spare the business and financial assets that make up the bulk of very large fortunes—so the overlap with our levy is small.

Spain is the leading case. Its recurrent wealth tax is regionally administered, and several regions (notably Madrid and Andalusia) had granted 100% relief until the central government introduced, in 2022, a Temporary Solidarity Tax on Large Fortunes (ITSGF) of 1.7%–3.5% above EUR 3 million, since made permanent, to reclaim that base. Yet the Spanish tax exempts business assets: shares held by owner-managers who hold a qualifying stake, play a managerial role and draw most of their income from the firm are relieved, and the primary residence is partly exempt. On top of this, a cap limits the combined income-and-wealth-tax bill to 60% of taxable income; but the resulting relief may not exceed 80% of the wealth-tax liability, so that at least 20% of it is always due (Article 31 of Law 19/1991). In practice this floor caps the effective wealth-tax rate of the asset-rich but income-poor at one fifth of the statutory rate—about 0.7% rather than the headline 3.5%. Together these carve-outs and caps let the very wealthiest largely escape the tax, and avoidance responses to it are well documented ([Directorate-General for Taxation and Customs Union \(European Commission\), 2026](#)).

France abolished its general wealth tax (ISF) in 2018 and replaced it with a narrow tax on real-estate wealth (IFI), at 0.5%–1.5% on net property above EUR 1.3 million—leaving financial and business wealth untaxed.

The Netherlands has no net-wealth tax at all: its “Box 3” regime taxes a *notional* return on savings and investments within the income tax, an approach the Supreme Court struck down in 2021 and again in 2024 (Section 4). From 2028 it is to be replaced by the Box 3 Actual Return Act, which taxes the *real* return on wealth: an annual mark-to-market (accrual) tax on the change in value of most assets and debts, combined with a realisation-based capital-gains tax on real estate and on shares in start-ups. This remains a tax on the return to wealth, not on the wealth stock itself, and so leaves the base our levy targets untouched.

Belgium levies a 0.15% annual tax on securities *accounts* worth at least EUR 1 million—a narrow charge that reaches listed portfolios but not directly held business stakes.

The proposed levy is therefore complementary rather than duplicative. Because it is one-off, values assets at market and grants *no* business-asset exemption, it falls, for very-high-net-worth individuals, precisely on the unlisted-company and financial holdings that the national taxes spare, while adding only 0.1% per year at the bottom of the schedule (above EUR 1 million). Where a taxpayer is simultaneously liable to a national recurrent wealth tax (the Spanish solidarity tax or the French IFI), the proposal treats them as cumulative, since even in the most heavily taxed cases the combined annual burden stays below the return on capital and therefore within the bounds courts have treated as non-confiscatory (Section 4).

## 4 Responses to main objections

### 4.1 Liquidity

The most common objection is that wealthy taxpayers, though rich on paper, may lack the cash to pay. The design answers this on two levels: the annual rate is low (at most 0.5% of wealth, payable out of normal capital income rather than principal), and payment can be made in shares, so that no market sale or cash outlay is required.

## 4.2 Reduced investment

A wealth tax could in principle reduce private investment by lowering the after-tax return to capital and by the consumption of tax revenue through public spending. This concern has much less force here for two reasons. First, the tax is one-off and backward-looking, so it does not alter the marginal return on any investment decided after 2027. Second, and decisively, the revenue is earmarked to a European sovereign wealth fund: assets withdrawn from private portfolios are re-invested, not consumed, so the aggregate capital stock is preserved and the composition merely shifts from private to collective ownership. The fund’s returns are designed to more than cover the servicing of the common debt, turning a one-off levy into a permanent public asset.

## 4.3 Deterring entrepreneurs

The claim that wealth taxes deter entrepreneurship applies to *recurrent* taxes that repeatedly claw back the fruits of success. It does not apply to a one-off tax on a past stock. An entrepreneur contemplating a new venture in 2028 faces no wealth-tax consequence from success, because the reference date has passed. The incentive to create, take risks and build is therefore left intact, which is precisely why [Pisani-Ferry and Mahfouz \(2023\)](#) and the classical public-finance literature on capital levies favour exceptional over permanent instruments.

## 4.4 Valuation

A recurring objection is that wealth is hard to value, especially unlisted businesses, real estate and art. The one-off design blunts this objection at the root: because the tax is assessed on a single reference date, assets need to be valued only once, exactly as they already are at death for inheritance tax, rather than re-valued every year. The recurring administrative cost that weighs on permanent wealth taxes therefore does not arise.

The experience of countries that value wealth annually shows the task is feasible but must be done at market value. Norway, which has levied a net-wealth tax without interruption since 1892, values listed shares at market, primary dwellings by hedonic pricing and other real estate by construction cost, and unlisted firms at their book value excluding intangible assets ([Directorate-General for Taxation and Customs Union \(European Commission\), 2026](#)). That last convention systematically under-values young, intangible-intensive companies—the very firms whose value lies in their brand, technology or growth prospects—so Norway’s base is, if anything, too generous to business owners. We therefore assess all assets at fair market value. The historical failures of wealth taxation came not from valuing assets at market but from the opposite—Germany and Austria taxed grossly under-valued real estate alongside market-valued financial assets, and it was that inequality of treatment, not valuation as such, that the courts condemned (Section 4).

## 4.5 The low yield of past wealth taxes

Sceptics point out that recurrent wealth taxes have historically raised little—around 0.2% of GDP in France (ISF) and Spain, and roughly 0.1% in the former German and Austrian taxes ([Directorate-General for Taxation and Customs Union \(European Commission\), 2026](#)). This is a critique of how those taxes were designed, not of wealth taxation as such. Their yield was hollowed out by three features that the present proposal rejects. First, generous exemptions for business assets. Second, income-based caps: for instance, France’s cap let the wealthiest 0.001% be taxed at an effective

rate of only about 0.1%. Third, annual assessment on a mobile base, which invited migration and avoidance year after year. Our levy grants no business-asset exemption, has no income cap (it is instead capped by an ability-to-pay ceiling on *current wealth*), and is assessed once on a past stock that cannot emigrate. It is precisely because it corrects these three defects that it raises as much revenue as old taxes did despite significantly lower tax rates.

## 4.6 Constitutionality

Whether a wealth tax is constitutional depends on the jurisdiction, and the history is instructive.

**Germany.** The Federal Constitutional Court suspended the wealth tax in its 1995 decision (2 BvL 37/91) not because wealth taxation is inherently unconstitutional, but because real estate was valued far below market while financial assets were valued at market, violating the equality principle of the Basic Law ([Bundesverfassungsgericht, 1995](#)). The same decision advanced the *Halbteilungsgrundsatz*: that wealth and income tax combined should not take away more than roughly half of the potential return of the taxed assets. Two points defuse this. First, the Court itself, in a later ruling, held the *Halbteilungsgrundsatz* not to be legally binding ([Directorate-General for Taxation and Customs Union \(European Commission\), 2026](#)). Second, the proposed tax would satisfy it in any case: an annual charge of at most 0.5% of wealth is only a small fraction—of the order of a tenth—of the normal return on capital, so that even added to income tax the combined burden stays far below half of that return. A uniformly market-valued, low-rate one-off tax thus avoids both defects that felled the German tax.

**Spain.** The Constitutional Court *upheld* the central solidarity wealth tax in December 2023 against challenges from several regions, confirming that a wealth tax is compatible with the Spanish constitution ([Tribunal Constitucional de España, 2023](#)).

**The Netherlands.** The Dutch case is often misread. The Netherlands abolished its genuine net-wealth tax in 2001 for practical, not legal, reasons: the old tax was widely avoided and evaded and raised little, so it was folded into the income tax as “Box 3”, which taxes a *notional* (assumed) return rather than actual wealth or actual income—a design chosen for administrative simplicity, not because taxing wealth was thought unconstitutional. It is precisely the taxation of a *fictitious* return that the Supreme Court struck down, in the 2021 “Christmas Judgment” and again in 2024, as an infringement of the right to property and the prohibition of discrimination under the European Convention on Human Rights ([Hoge Raad der Nederlanden, 2021](#)); the Netherlands is now moving to a tax on *actual* returns from 2028. A charge levied on *actual* wealth, with an ability-to-pay safeguard, does not share this flaw—if anything the Dutch saga shows that taxing real wealth is on firmer legal ground than taxing an imputed one.

**France.** The Conseil constitutionnel has repeatedly upheld wealth taxation (the ISF and later the IFI), on two conditions: that ability to pay may be assessed on wealth ownership rather than income flows (Decision n° 2019-769 QPC), and that the burden not become confiscatory, which for a holding tax may require an income-based cap only when the rate is high ([Conseil des prélèvements obligatoires, 2018](#); [Conseil constitutionnel, 2012](#)). The threshold is telling: in the ISF case-law a rate of 0.5% was validated *without* any cap, whereas a rate of 1.8% required one ([Conseil des](#)

[prélèvements obligatoires, 2018](#)). The maximum annual rate proposed here is 0.5%—at the very level the Conseil accepted with no cap—so the French standard is comfortably met.

**Austria.** Austria discontinued its wealth tax in 1993 by an act of government, not of any court, and for reasons of design rather than principle: fear of capital flight, widespread evasion, high administrative cost, and low and declining revenue, compounded by the unequal treatment of grossly under-valued real estate (the same defect that later led the Constitutional Court to strike down the Austrian inheritance tax) ([Directorate-General for Taxation and Customs Union \(European Commission\), 2026](#)). One genuine legal obstacle is specific to Austria: Article 1(1)(2) of the constitutionally entrenched Final Taxation Act (*Endbesteuerungsgesetz*) bars any wealth tax on domestic bank deposits and domestically issued bonds. Overcoming it would require either amending that constitutional law by a two-thirds majority, or granting Austria the option to exempt those asset classes—which in any case make up only a small share of large fortunes. The Austrian experience is thus a catalogue of avoidable design failures, not evidence that wealth cannot be taxed.

**European law.** Two European-level points complete the picture. First, Article 1 of Protocol No. 1 to the European Convention on Human Rights protects the peaceful enjoyment of possessions but explicitly permits States to levy taxes, subject to a “fair balance” between the general interest and the individual burden; the Court finds a violation only where the charge is disproportionate or confiscatory, and a one-off levy of at most 0.5% of wealth per year with an ability-to-pay ceiling sits well within that margin. Second, Article 345 of the Treaty on the Functioning of the European Union provides that “the Treaties shall in no way prejudice the rules in Member States governing the system of property ownership”: EU law is neutral as between private and public ownership, so using the proceeds to build up collective, public ownership of productive capital raises no objection under the Treaties.

The recurring constitutional theme across jurisdictions is that wealth taxes fail when they value assets unequally, tax fictitious returns, or become confiscatory—never simply because they tax wealth. The present design is built to avoid all three failure modes.

## 5 Possible variants

Several variants are compatible with the architecture above but are left for future work and not developed here: (i) converting the one-off levy into a *permanent* recurrent wealth tax; (ii) applying *higher rates*, closer to the top-heavy scenario of Table 1 or to the 2%–3% minimum-tax proposals of [Zucman \(2024\)](#); (iii) pairing the wealth tax with a reform of *inheritance taxation*, which reaches the same tax base at the point of transmission; and (iv) allocating the revenue to general *government spending* rather than to a sovereign wealth fund. Each of these would change the efficiency, distributional and political properties of the instrument and deserves separate analysis.
